

## EIGHT POINT.ONE SOLAR CHARGING STATION

### HOW DOES IT WORK?

- <sup>1</sup> **Electricity generation**  
The built-in, highly efficient solar modules in the Point.One generate environmentally friendly and CO<sub>2</sub>-free electricity both when there is plenty of sunshine and when there is less light.
- <sup>2</sup> **Energy storage**  
When there is no car being charged, the solar power is fed back into the power grid. On days with less sunshine, the lower amounts of solar energy produced can be topped-up with electricity from the grid.
- <sup>3</sup> **Mobility**  
When an electric car is connected to the solar charging station, its batteries are charged with the generated electricity.
